

Analysis

There are a couple of things I could gather from the data, described below.

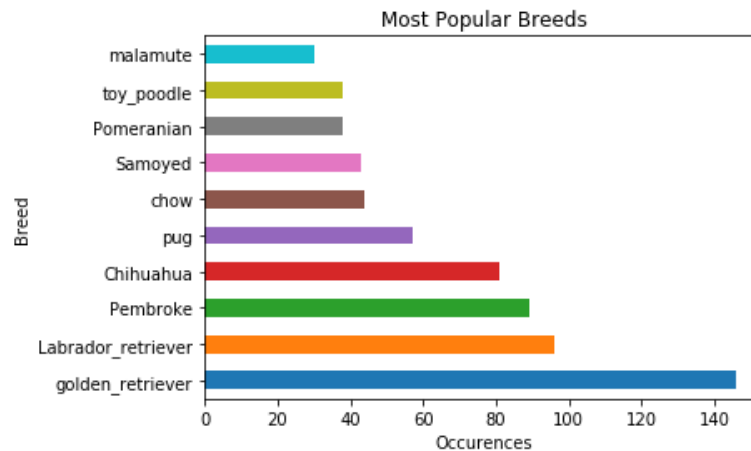

iPhones are popular, we all know that. Take a random sample from anywhere and you'll most probably find suggestive results - this dataset is no different. iPhones represent the vast majority of twitter users in this group.

iPhone	1438
Web	16
TweetDeck	7

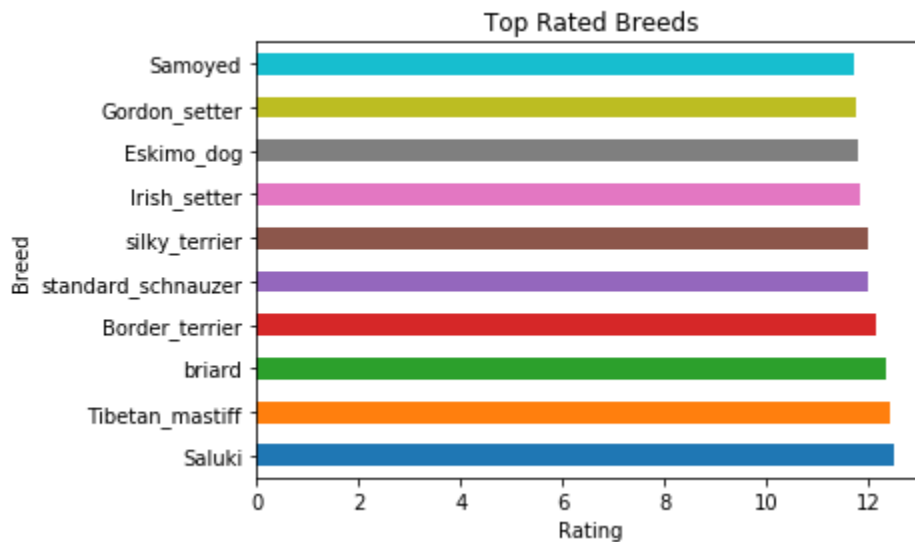

However, there doesn't seem to be any correlation between whether certain sources tend to have higher ratings - which should be the case just through sheer numbers that having an iPhone corresponds to a higher score; but this doesn't happen.

What are the most common breeds, you might ask? If you are ever on the internet, then you'd wager that golden retrievers would be somewhere up there. We can all agree that this breed is overrepresented due to its popularity - and the data describes this well. Goldies and Labradors are among the top five, and not far behind are Chihuahuas and Pugs.

If people like these breeds so much, we'd expect their ratings to be on the high end. But this isn't as clear-cut as the breed popularity. Though some names only occur once, goldies are all the way down to 13th place.

If, however we average the top occurring breeds' ratings (instead of just all of them, which might be skewed data because of only one occurrence), we more sensible results. With the largest number, golden retrievers manage an average rating of 11.56, the highest in the top 5. Next is the Pembroke, followed by the Labrador, chihuahua and finally the pug. However, since we don't have the same number of rows for every dog, we can't say for sure which breed gets' the best ratings. Unless we bootstrap the data.

Another thing we can quickly glance at is what the most common dog ages are (using WeRateDogs' own specialized and highly accurate rating scale). My initial guess was that puppies are the most common tweets – I was not mistaken.
